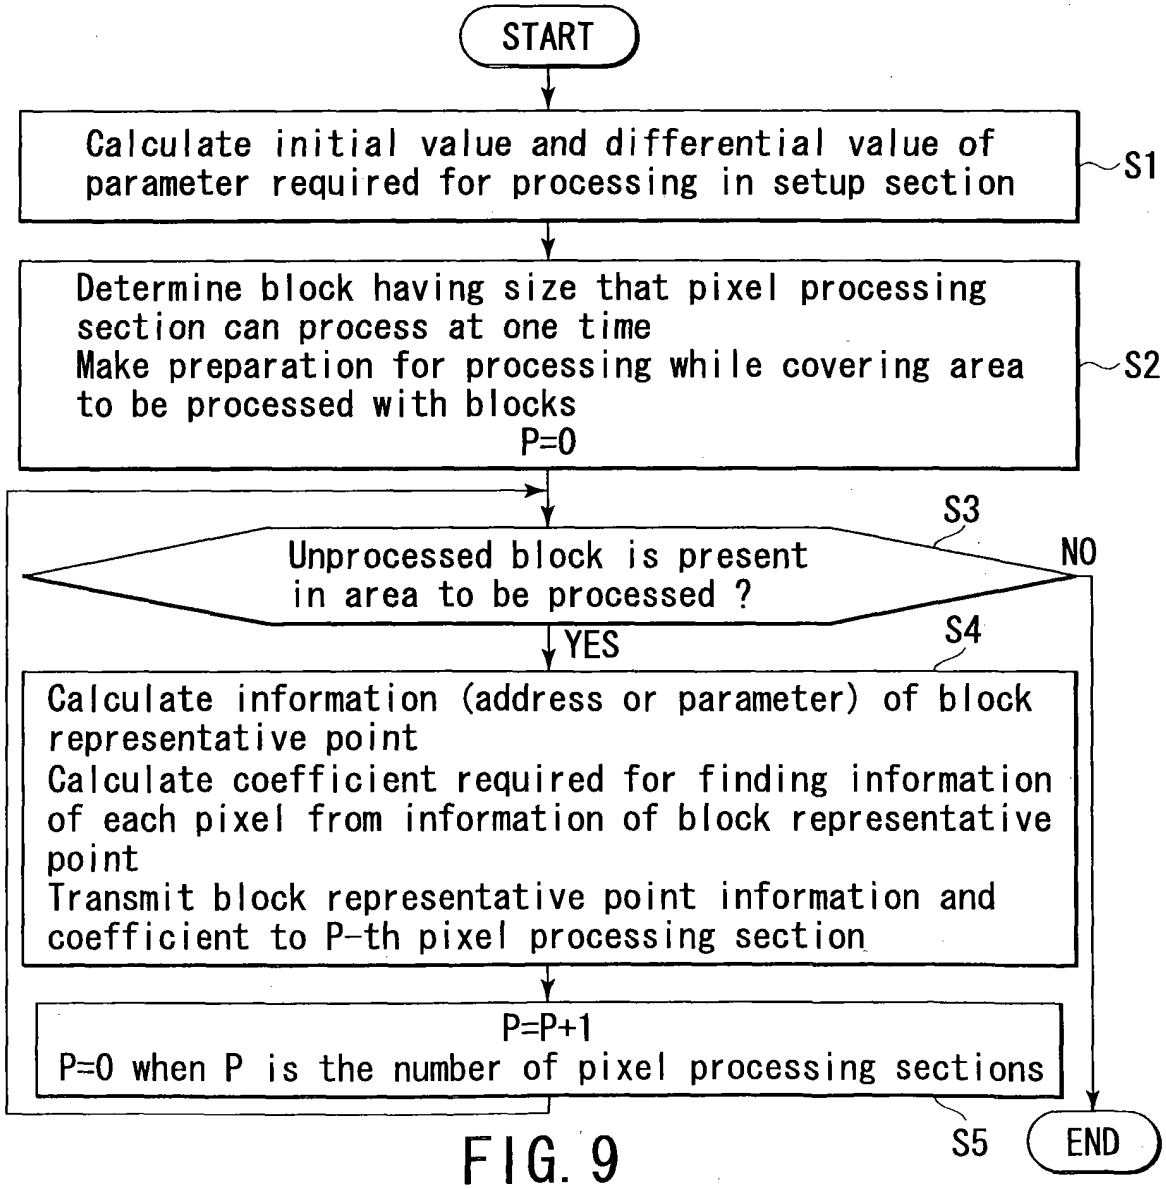
FIG. 8



START
Calculate initial value and differential value of parameter required for processing in setup section
S1
Determine block having size that pixel processing section can process at one time
Make preparation for processing while covering area to be processed with blocks
P=0
S2
S3
Unprocessed block is present in area to be processed ?
NO
YES
S4
Calculate information (address or parameter) of block representative point
Calculate coefficient required for finding information of each pixel from information of block representative point
Transmit block representative point information and coefficient to P-th pixel processing section
P=P+1
P=0 when P is the number of pixel processing sections
S5
END

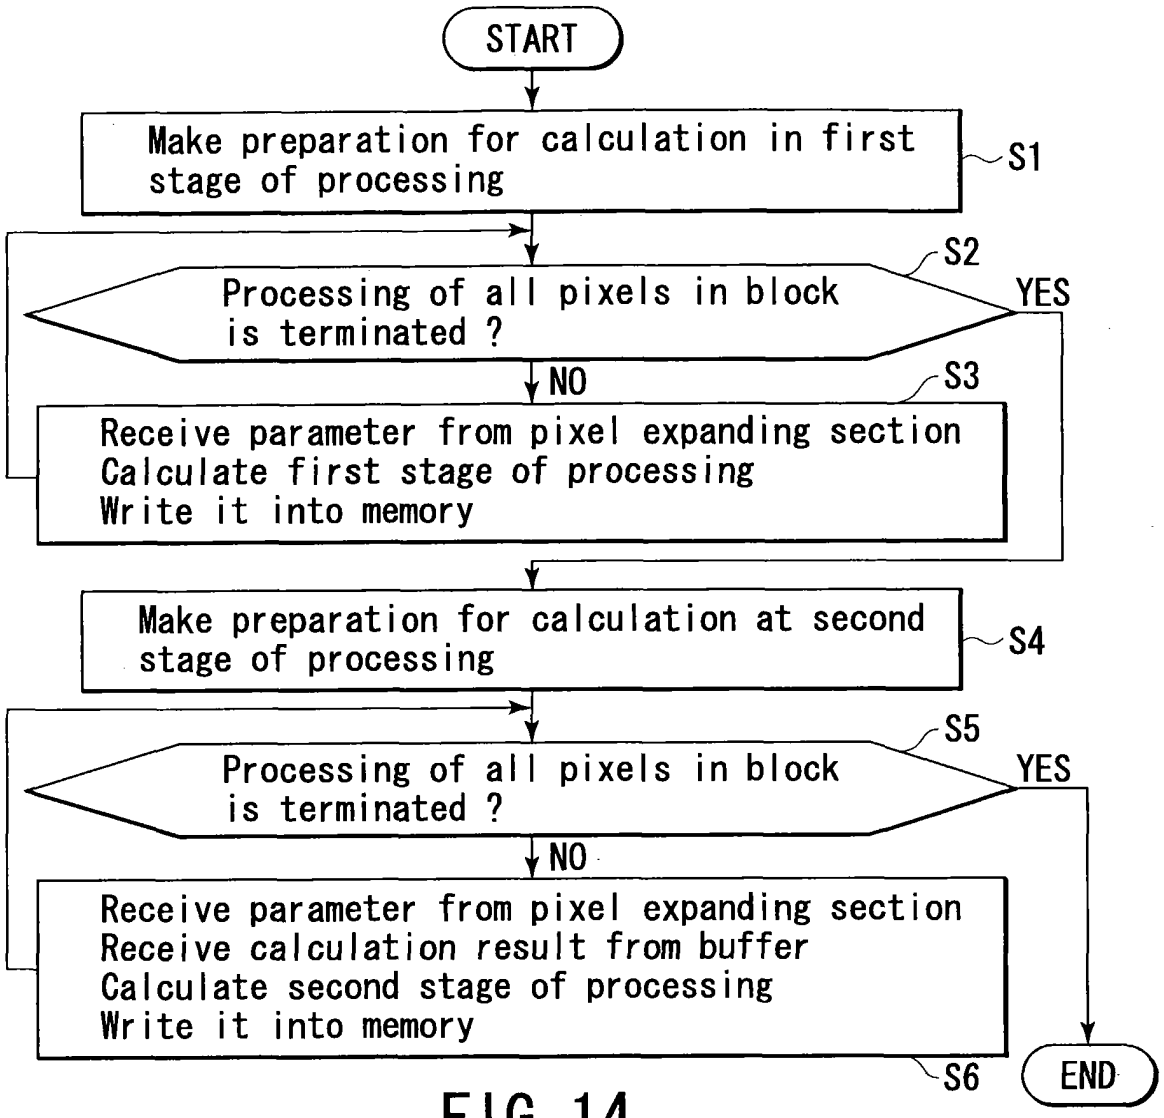
FIG. 13



START
Make preparation for calculation in first stage of processing
S1
S2
Processing of all pixels in block is terminated ?
YES
NO
S3
Receive parameter from pixel expanding section
Calculate first stage of processing
Write it into memory
Make preparation for calculation at second stage of processing
S4
S5
Processing of all pixels in block is terminated ?
YES
NO
Receive parameter from pixel expanding section
Receive calculation result from buffer
Calculate second stage of processing
Write it into memory
S6
